Daily OPS Report
7/3/12

Kenedy Texas

On 7/3/2018 EPA and START continued air monitoring operations outside of Newpark Drilling Fluids facility in Country Village of Kenedy Apartments and Kenedy Suites Apartments. The Apartments are located just to the North and North West of the site. There were not any abnormal or high reading observed on EPA/START air monitoring equipment. EPA and START observed soil removal/remediation actions taking place from the fire water pathways located on the east side of Newparks facility located next to US-181. EPA and START also observed the installation of two underflow dams in the pathway of the firewater runoff. There will be a total of 4 underflow dams installed in the water runoff pathway. The underflow dams are being installed in strategic locations to prevent the entry of contaminants from the firewater running off into Escondido Creek. The weather call for rain in the area and the RP want to make sure no fire water contamination leave the area and in the Creek. The local fire departments and the RP construction contractor are still in the process of having the fire 100% suppressed. The South and western walls of the build were removed to have access to the control box and extinguish any remaining fires. The Contractor will continue to remove material from the building and suppressed any small fire remaining. EPA Demobilized from the site as of 1700 leave the a START contractor to observe the remaining cleanup.
